Project Concept

We want to focus on conveying water off an area that has issues with ponding and/or introduce a solution that implements water quality if feasible. In reference, we are interested in possibly doing something that links our project to the Waller Creek Conservancy Project.

Given the university issues presented to us, we're looking to focus on the staff parking lot 53 (option 1) due to its proximity to Waller Creek. We know that this parking lot drains into Waller Creek and we know that parking lots are high in surface pollutants. Therefore, we are looking to implement a solution that will involve infiltrating the runoff and filtering it as much as possible before it gets to the creek.
