**A SPATIAL AND STATISTICAL ASSESSMENT OF THE
VULNERABILITY OF TEXAS GROUNDWATER
TO NITRATE CONTAMINATION**

ACKNOWLEDGMENTS

The work presented in this dissertation was supported by the United States Environmental Protection Agency, through agreement number CR818116, administered by the Environmental Monitoring Systems Laboratory. Grateful acknowledgment and credit for the data analyzed here are due to the staffs of the Texas Water Development Board, the Water Utilities Division of the Texas Natural Resource Conservation Commission, the US Geological Survey, and the Soil Conservation Service of the US Department of Agriculture. Robert Blodgett, Roger Quincy, and William Battaglin deserve individual recognition, as do a number of others, who, alas, will not receive it here.

This work could not have been completed without the support of my dissertation committee, Philip Bennett, Randall Charbeneau, Raymond Loehr, Daene McKinney, and especially Professor David Maidment, who paid the bills.

Finally, the author wishes to thank the Burgin family for life support, and Brenda Nelson and Sheri Whitley for actions above and beyond the call of their job descriptions.

ABSTRACT

Nitrate concentrations in approximately 46,000 water samples from Texas wells are analyzed using spatial and statistical representations on a grid of 7.5' quadrangles. In each quadrangle containing at least 12 measurements, the probabilities of exceeding four threshold concentrations (0.1, 1.0, 5.0, and 10.0 mg/l nitrate as nitrogen) are estimated as the ratio of observed exceedences to the total number of measurements. An alternative probability analysis using the lognormal distribution yields exceedence probabilities that show some systematic difference from those computed directly from the data.

Five representative aquifers were chosen for additional analysis. Nitrate exceedence probabilities are relatively uniform within aquifers, but differ significantly from one aquifer to another. The exceedence probability for the 1 mg/l threshold was selected as best representing vulnerability to nitrate contamination. The five aquifers, ranked from lowest to highest vulnerability by this criterion are: Carrizo-Wilcox, Edwards (Balcones Fault Zone), Hueco-Mesilla Bolson, Ogallala, and Seymour. Evidence suggests that nitrate levels are increasing across the state, and in the Ogallala in particular, but such trends are not consistent across aquifers.

Linear regression was used to assess the relationship between nitrate exceedence probabilities potential indicator parameters. The dominant parameter is the aquifer from which the sample is drawn. Setting this aside, the only consistently significant indicator is average annual rainfall: groundwater is more likely to be contaminated in regions where rainfall is low than in regions

where rainfall is high. No significant relation between the spatial patterns of nitrate contamination and the sale of nitrogen fertilizers was found.

Table of Contents

List of Figures.....	9
List of Tables.....	13
Chapter 1: Introduction	16
1.1 Motivation	18
1.2 Objectives.....	25
1.3 Scope of Study.....	26
1.4 Project Summary	26
1.5 Contributions of Study	27
1.6 Outline of Dissertation	28
Chapter 2: Background and Literature Review	30
2.1 Uses for Groundwater Vulnerability Assessment	30
2.2 Groundwater Vulnerability Assessment methods.....	32
2.3 Statistical Groundwater Vulnerability Assessment	37
2.4 Choice of Method.....	41
2.5 Nitrate in Groundwater.....	44
2.6 Outline of Proposed Vulnerability Analysis Method.....	49
2.6.1 Comparison of Method with Previous Studies.....	50
2.6.2 Application in Present Work.....	53
Chapter 3: Data Sources and Description	55
3.1 Nitrate Measurement Data	56
3.1.1 Nitrate Reporting Limits	58
3.1.2 Sampling Period	60
3.1.3 Measurement Record Accuracy	61
3.2 Well Data.....	63
3.2.1 TWDB Well Numbers.....	63

3.2.2	Location Accuracy	67
3.2.3	Selected Aquifers	68
3.2.4	Well Description Accuracy	72
3.3	Soil Data	74
3.3.1	STATSGO Map and Data Structure.....	74
3.3.2	Using STATSGO Data	80
3.3.3	Range and Distribution of Soil Parameter Values	88
3.4	Precipitation Data.....	93
3.4.1	Preparation of Annual Average Precipitation Map.....	93
3.4.2	Range and Distribution of Precipitation Data.....	96
3.5	Fertilizer Sales Data	97
3.6	Water Utilities Division Nitrate Monitoring Data.....	100
3.7	Herbicide and Nitrate Data from Midwestern U.S.	101
Chapter 4:	Methods	103
4.1	Nitrate as a Surrogate for Vulnerability.....	104
4.2	Identification of Analysis Regions.....	107
4.3	Grouping Data for Analysis.....	113
4.3.1	Database Management Systems	113
4.3.2	Geographic Information Systems.....	119
4.4	Statistical Model of Vulnerability.....	124
4.4.1	Discrete Probability Estimates	127
4.4.2	Lognormal Probability Estimates	137
4.4.3	Discussion.....	143
4.5	Mapping of Indicator Parameters.....	147
4.5.1	Polygons and Their Attributes.....	148
4.5.2	Overlaying Polygons	150
4.5.3	Raster Cells and Attributes.....	150
4.5.4	Rasterized Polygons: A Compromise	153
4.6	Regression on Indicators	154

4.7 Confirming Assumptions.....	156
Chapter 5: Procedures	158
5.1 Important Features of INFO and TABLES	158
5.2 Data Entry.....	164
5.2.1 TWDB Well and Nitrate Data.....	164
5.2.2 Soil Data	169
5.2.3 Precipitation Data.....	169
5.2.4 Fertilizer Sales Data	172
