## GIS in Water Resources Exercise \#3 Solution

Part 1. Slope Calculations
1.1 Hand Calculation (Point A only):
(i) ESRI Slope

| 45.4 | 46.1 | 47 | 48.6 | 47.7 |
| :--- | :--- | :--- | :--- | :--- |
| 45 | 46.1 | $46.4 ~ B$ | 47.9 | 47.4 |
| 45.1 | 45.8 | 46.8 A | 48.6 | 47.6 |
| 47.5 | 48 | 47.7 | 50.6 | 48.3 |

Cell Referencing

| a | b | c |
| :--- | :--- | :--- |
| d | e | f |
| g | h | i |

Equations:
c_size $=10 \mathrm{~m}$
$\mathrm{dz} / \mathrm{dx}=((\mathrm{a}+2 \mathrm{~d}+\mathrm{g})-(\mathrm{c}+2 \mathrm{f}+\mathrm{i})) / 8^{*} \mathrm{c}$ _size
$=\left(\left(46.1+2^{*} 45.8+48\right)-\left(47.9+2^{*} 48.6+50.6\right)\right) /\left(8^{*} 10\right)=-0.125$
$\mathrm{dz} / \mathrm{dy}=((\mathrm{g}+2 \mathrm{~h}+\mathrm{i})-(\mathrm{a}+2 \mathrm{~b}+\mathrm{c})) / 8^{*}$ c_size

$$
=((46.1+2 * 46.4+47.9)-(48+2 * 47.7+50.6)) /(8 * 10)=0.09
$$

These represent the x and y components of the slope vector shortened as follows
$\Delta \mathrm{x}=\mathrm{dz} / \mathrm{dx}=-0.125$
$\Delta y=d z / d y=0.09$
slope $($ rise $/$ run $)=\operatorname{sqrt}\left(\Delta x^{\wedge} 2+\Delta y^{\wedge} 2\right)=\operatorname{sqrt}\left((-0.125)^{\wedge} 2+(0.09)^{\wedge} 2\right)=0.154$
slope $($ angle $)=\operatorname{atan}($ slope $($ rise $/$ run $))=\operatorname{atan}(0.154)=0.153$ rads $=8.76$ degrees
Note: degrees = rads * 180/ $\pi$. Calculators can be set to return rads or degrees. Excel and computer programs usually return rads.
aspect $=\operatorname{atan}(\Delta x / \Delta y)=\operatorname{atan}(-0.125 / 0.09)=-0.95$ rads $=-54.2$ degrees
This is an angle in the NW quadrant since x component is negative and y component positive. Add 360 degrees to get the angle clockwise from north
aspect $=360+(-54.2)=305.75$

The following Excel Object includes the formulae. You can double click on this to open this object in Excel.

| (i) ESRI Standard Slope Function |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Grid size | 10 | m |  |  |  |  |  |
| 45.4 | 46.1 | 47 | 48.6 | 47.7 | $d z / d x=$ | -0.125 |  |
| 45 | 46.1 | 46.4 | 47.9 | 47.4 | $d z / d y=$ | 0.0900 |  |
| 45.1 | 45.8 | 46.8 | 48.6 | 47.6 |  |  |  |
| 47.5 | 48 | 47.7 | 50.6 | 48.3 | rise/run= | 0.154029 |  |
|  |  |  |  |  | Slope= | 0.152828 | radians |
|  |  |  |  |  |  | 8.756408 | degree |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  | Aspect | -0.94677 | radians |
|  |  |  |  |  |  | -54.2461 | degree |
|  |  |  | Result as angle clockwise from North |  |  | 305.7539 | degree |
| (This is an Excel Object so you can click on it to see the formulas) |  |  |  |  |  |  |  |

(ii) The 8 direction pour point model D8

Slope is calculated separately to each adjacent grid cell using the formula Slope $=($ Center elevation - Side elevation)/Distance
Distance to diagonal side cells is the diagonal distance $\sqrt{2} *$ cell size
The following Excel object includes these calculations.

| ii) D8 | Center cell | 46.8 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Distances | Side | 10 | Diagonal | 14.14214 |  |  |  |  |
| Direction | Value | Distance | Slope |  |  |  |  |  |
| 1 | 48.6 | 10 | -0.180 |  | Direction E | coding |  |  |
| 2 | 50.6 | 14.142 | -0.269 |  | 32 | 64 | 128 |  |
| 4 | 47.7 | 10 | -0.090 |  | 16 | - | 1 |  |
| 8 | 48 | 14.142 | -0.085 |  | 8 | 4 | 2 |  |
| 16 | 45.8 | 10 | 0.100 | Maximum (positive down) slope to cell in direction 16 |  |  |  |  |
| 32 | 46.1 | 14.142 | 0.049 |  |  |  |  |  |
| 64 | 46.4 | 10 | 0.040 |  |  |  |  |  |
| 128 | 47.9 | 14.142 | -0.078 |  |  |  |  |  |
|  |  |  |  |  |  |  |  |  |
| (This is an Excel Object so you can click on it to see the formulas) |  |  |  |  |  |  |  |  |

Note that the steepest 8 direction pour point model slope in direction 16 is:

$$
\frac{\text { centercell }- \text { sidecell16 }}{\text { cellsize }}=\frac{46.8-45.8}{10}=0.10
$$

D8 Slope: 0.1
D8 Direction: 16

## Differences

Represented as an aspect the D8 direction would be 270 degrees, but simply stating the direction as 16 or to the W is sufficient.

The main difference is that the ESRI slope considers all 8 surrounding grid cell values, and curiously, not the actual grid cell value. It represents the slope of a polynomial surface fit to all these grid cells. The D8 method only considers adjacent elevations lower than the center cell which is consistent with the assumption of where water would flow not being influenced by adjacent neighbors that are higher.

The D8 flow direction is to the W, while the ESRI slope aspect is to the NW significantly influenced by the cell with value of 50.6 to the SE. The ESRI slope is probably most appropriate for computation of quantities such as illumination due to sunlight in energy balance calculations where the slope of the surface fit based on all surrounding values seems best, but for the flow of water, the D8 method is better.
1.2 Verifying calculations using ArcGIS

The values at cell A of Slope $=15.4 \%$, Aspect $=305.8$ deg, PercDrop $=10 \%$ and FlowDir=16 correspond to the hand calculations

Cell A vs. Cell B (zoomed-in view of below identification in ArcGIS Pro):

## CELL A

4 elev.asc
D 46.799999
4 slope
D 15,402920
4 aspect
D 305.753876
4 FlowDir
D 16
4 PercDrop
D 10.000000

## CELL B

4 elevasc
D 46,400002
4 slope
D 11.159364
4 aspect
D 265.502838
4 FlowDir
D 8
4 PercDrop
D 3.333333

At cell A:

At cell B:

2. Summary of ArcGIS Calculated:

| Point | Slope (\%) | Aspect (deg) | D8 Slope (\%) | Flow Dir (D8) |
| :--- | :--- | :--- | :--- | :--- |
| A | 15.4 | 305.8 | 10 | 16 |
| B | 11.2 | 265.5 | 3.33 | 8 |

Note that if you look at the data underlying D8 slope at B you have

| 46.1 | 47 | 48.6 |
| ---: | ---: | ---: |
| 46.1 | 46.4 | 47.9 |
| 45.8 | 46.8 | 48.6 |

The percentage drop in direction 8 (indicated with arrow) should thus be (46.4-45.8)/(SQRT(2)*10) $=0.0424=4.24 \%$

The fact that the ArcGIS function is reporting $3.33 \%$ is, I believe, a bug. Buyer beware!

## 3. Model Builder Output

4. Table: Summary of Demo.asc Ouputs

| Layer | Min | Max |
| :--- | :--- | :--- |
| Slope | 0 | 149 |
| Aspect | -1 | 360 |
| Flow Dir | 1 | 128 |
| PercDrop | 0.066 | 146.6 |

-1 for aspect is used to represent flat grid cells
5. DEM Summary (projdem.tif)

Rows: 2745
Columns: 4222
Cell Size: $30 \times 30$
Min: 69.7651
Max: 618.532
6.

7.

8. Subwatershed Elevation Summary

| HydroID | SiteName | Elev. Range (m) | Elev Mean (m) |
| ---: | :--- | ---: | ---: |
| 330 | Plum Ck at Lockhart, Tx | 137.72 | 189.86 |
| 331 | Blanco Rv at Wimberley, Tx | 372.98 | 418.48 |
| 332 | Blanco Rv nr Kyle, Tx | 215.84 | 288.57 |
| 333 | San Marcos Rv at San Marcos, Tx | 218.47 | 266.11 |
| 334 | Plum Ck nr Luling, Tx | 115.88 | 151.94 |
| 335 | San Marcos Rv at Luling, Tx | 311.96 | 183.53 |

Highest: Blanco Rv at Wimberley, TX
Largest Range: Blanco Rv at Wimberley, TX
9. Area Average Precipitation using Thiessen Polygons

| HydroID | SiteName | SubW Precip (in) |
| :---: | :--- | ---: |
| 330 | Plum Ck at Lockhart, Tx | 36.37 |
| 331 | Blanco Rv at Wimberley, Tx | 37.83 |
| 332 | Blanco Rv nr Kyle, Tx | 40.48 |
| 333 | San Marcos Rv at San Marcos, Tx | 40.48 |
| 334 | Plum Ck nr Luling, Tx | 36.52 |
| 335 | San Marcos Rv at Luling, Tx | 37.59 |

The highest mean precipitation is found for the San Marcos River at San Marcos and Blanco River near Kyle watersheds. These are identical, because they are both in the same polygon.

10. Area average mean annual precipitation using Spatial Interpolation/Surface fitting (Tension Spline Method)

| HYDROID | SiteName | Precip (inches) |
| ---: | :--- | ---: |
| 330 | Plum Ck at Lockhart, Tx | 36.22 |
| 331 | Blanco Rv at Wimberley, Tx | 37.89 |
| 332 | Blanco Rv nr Kyle, Tx | 39.79 |
| 333 | San Marcos Rv at San Marcos, Tx | 39.66 |
| 334 | Plum Ck nr Luling, Tx | 36.46 |
| 335 | San Marcos Rv at Luling, Tx | 37.99 |

Blanco Rv nr Kyle, TX has the highest mean precipitation estimated from Tension Spline Interpolation.
